

Preparatory Assignment for Quiz 1—**Key**

CENG 340—Introduction to Environmental Engineering

Instructor: Deborah Sills

September 11, 2013

1. $\rho_{water} = 1 \frac{\text{g}}{\text{mL}} = 1000 \frac{\text{g}}{\text{L}}$

$$[VC] = 0.002 \frac{\text{mg VC}}{\text{L total}} \times \frac{1 \text{ g VC}}{1000 \text{ mg VC}} \times \frac{1 \text{ L solution}}{1000 \text{ g solution}} = 2 \times 10^{-9} \frac{\text{g VC}}{\text{g solution}}$$

$$[VC] = 2 \times 10^{-9} \frac{\text{g VC}}{\text{g solution}} \times \frac{10^6 \text{ ppm}_m}{\frac{\text{g}}{\text{g}}} \times \frac{10^3 \text{ ppb}_m}{\text{ppm}_m} = 2 \text{ ppb}_m$$

2. Molecular weight of N = $14 \frac{\text{g}}{\text{mole}}$
Molecular weight of NO_3^- = $62 \frac{\text{g}}{\text{mole}}$
 $\text{MCL}_{\text{NO}_3^-} = 10 \frac{\text{mg-N}}{\text{L}}$

- Does the concentration of NO_3^- violate the MCL?

$$[\text{NO}_3^-] = 10 \frac{\text{mg}}{\text{L}} \times \frac{14 \text{ mg N}}{62 \text{ mg NO}_3^-} = 2.3 \frac{\text{mg-N}}{\text{L}} < 10 \frac{\text{mg-N}}{\text{L}}$$

MCL not violated.

- MCL Concentration in units of ppm_m :

$$[\text{NO}_3^-]_{\text{MCL}} = 10 \frac{\text{mg-N}}{\text{L}} = 10 \text{ ppm}_m \text{ as N}$$

- MCL Concentration in units of $\frac{\text{mole}}{\text{L}}$:

$$[\text{NO}_3^-]_{\text{MCL}} = 10 \frac{\text{mg-N}}{\text{L}} \times \frac{1 \text{ g}}{1000 \text{ mg}} \times \frac{1 \text{ mole}}{14 \text{ g}} = 7.1 \times 10^{-4} \frac{\text{mole}}{\text{L}}$$

- MCL Concentration in units of ppb_m :

$$[\text{NO}_3^-]_{\text{MCL}} = 10 \text{ ppm}_m \times \frac{10^3 \text{ ppb}_m}{1 \text{ ppm}_m} = 10,000 \text{ ppb}_m \text{ as N}$$

3. Outdoor air-quality 1-h standard: $[\text{CO}] = 35 \frac{\text{mg}}{\text{m}^3}$
 At Lynah Rink: $[\text{CO}]_{\text{low}} = 35 \text{ ppm}_v$, and $[\text{CO}]_{\text{high}} = 115 \text{ ppm}_v$

Part One:

- **Step 1: Convert $[\text{CO}]_{\text{std}}$ from $\frac{\text{mg}}{\text{m}^3}$ to $\frac{\text{mole}}{\text{m}^3}$**

Molecular weight of CO = 12 + 16 = 28 $\frac{\text{g}}{\text{mole}}$

$$[\text{CO}]_{\text{std}} = 35 \frac{\text{mg}}{\text{m}^3} \times \frac{1 \text{ mole}}{28 \text{ g}} \times \frac{1 \text{ g}}{1000 \text{ mg}} = 1.25 \times 10^{-3} \frac{\text{mole}}{\text{m}^3}$$

- **Step 2: Convert $[\text{CO}]_{\text{std}}$ from $\frac{\text{mole}}{\text{m}^3}$ to $\frac{\text{m}^3}{\text{m}^3}$**

Use the ideal gas law: $PV = nRT$, where (1) temperature in Kelvin (K) = temperature in Celsius ($^{\circ}\text{C}$) + 273.15, (2) the ideal gas constant $R = 8.205 \times 10^{-5} \frac{\text{m}^3 \times \text{atm}}{\text{mole} \times \text{Kelvin}}$, and (3) $P = 1 \text{ atm}$.

$$\begin{aligned} [\text{CO}]_{\text{std}} &= \frac{1.25 \times 10^{-3} \text{ moles CO} \times \frac{R \times T}{P}}{\text{m}^3 \text{ air}} = \\ &= \frac{1.25 \times 10^{-3} \text{ moles CO} \times \frac{8.205 \times 10^{-5} \frac{\text{m}^3 \times \text{atm}}{\text{mole} \times \text{K}} \times 293.15 \text{ K}}{1 \text{ atm}}}{\text{m}^3 \text{ air}} = 3.01 \times 10^{-5} \frac{\text{m}^3 \text{ CO}}{\text{m}^3 \text{ air}} \end{aligned}$$

- **Step 3: Convert $[\text{CO}]_{\text{std}}$ from $\frac{\text{m}^3}{\text{m}^3}$ to ppm_v :**

$$[\text{CO}]_{\text{std}} = 3.01 \times 10^{-5} \frac{\text{m}^3 \text{ CO}}{\text{m}^3 \text{ air}} \times 10^6 \frac{\text{ppm}_v}{\frac{\text{m}^3}{\text{m}^3}} = 30 \text{ ppm}_v$$

At Lynah $[\text{CO}]$ ranges from 35 to 115 ppm_v —violates the air quality standard all of the time. Prof. Sills might want to bring a gas mask.

Part Two:

$$[\text{CO}] \text{ in units of } \text{ppm}_v = \frac{P_i}{P_{\text{air}}} \times 10^6$$

$$P_i(\text{low}) = \frac{35 \text{ ppm}_v \times 1 \text{ atm}}{10^6} = 3.5 \times 10^{-5} \text{ atm}$$

$$P_i(\text{high}) = \frac{115 \text{ ppm}_v \times 1 \text{ atm}}{10^6} = 1.15 \times 10^{-4} \text{ atm}$$

The partial pressure of CO at Lynah Rink ranges from $3.5 \times 10^{-5} \text{ atm}$ to $1.15 \times 10^{-4} \text{ atm}$.

4. Convert $10 \frac{g}{L}$ to $\frac{mole}{L}$:

$$[NaOH] = 10 \frac{g}{L} \times \frac{1 \text{ mole}}{40 g} = 0.25 \frac{\text{mole}}{L}$$

$$[Na_2SO_4] = 10 \frac{g}{L} \times \frac{1 \text{ mole}}{142 g} = 0.07 \frac{\text{mole}}{L}$$

$$[K_2Cr_2O_7] = 10 \frac{g}{L} \times \frac{1 \text{ mole}}{294 g} = 0.03 \frac{\text{mole}}{L}$$

$$[KCl] = 10 \frac{g}{L} \times \frac{1 \text{ mole}}{74.5 g} = 0.13 \frac{\text{mole}}{L}$$

5. $MW_{[HCO_3^-]} = 61 \frac{g}{mole}$

$$[HCO_3^-] = 50 \frac{mg}{L} \times \frac{1 \text{ mole}}{60 g} \times \frac{1 g}{1000 mg} = 8.2 \times 10^{-4} \frac{\text{mole}}{L}$$

$$[HCO_3^-] = 8.2 \times 10^{-4} \frac{\text{mole}}{L} \times \frac{1 \text{ equivalent}}{\text{mole}} = 8.2 \times 10^{-4} \frac{\text{eq}}{L}$$

$$[HCO_3^-] = 8.2 \times 10^{-4} \frac{\text{eq}}{L} \times \frac{50 g \text{ CaCO}_3}{\text{eq}} \times \frac{1000 mg}{g} = 41 \frac{mg}{L}$$

6. *Step One: Convert $[Ca^{2+}]$, $[Mg^{2+}]$, and $[Mn^{2+}]$ from units of $\frac{mg}{L}$ to hardness as $\frac{meq}{L}$.*

$$[Ca^{2+}] = 42 \frac{mg}{L} \times \frac{1 \text{ mole}}{40 g} \times \frac{2 \text{ eq}}{\text{mole}} = 2.1 \frac{\text{meq}}{L}$$

$$[Mg^{2+}] = 12 \frac{mg}{L} \times \frac{1 \text{ mole}}{24 g} \times \frac{2 \text{ eq}}{\text{mole}} = 1.0 \frac{\text{meq}}{L}$$

$$[Mn^{2+}] = 10 \frac{mg}{L} \times \frac{1 \text{ mole}}{55 g} \times \frac{2 \text{ eq}}{\text{mole}} = 0.36 \frac{\text{meq}}{L}$$

Step Two: Calculate total hardness in units of $\frac{meq}{L}$.

$$\text{Total Hardness} = [Ca^{2+}] + [Mg^{2+}] + [Mn^{2+}] = 2.1 + 1.0 + 0.36 = 3.46 \frac{\text{meq}}{L}$$

Step Three: Convert total hardness from units of $\frac{meq}{L}$ to $\frac{mg-CaCO_3}{L}$.

$$\text{TotalHardness} = 3.46 \frac{\text{meq}}{L} \times \frac{50 g \text{ CaCO}_3}{\text{eq}} = 173 \frac{mg \text{ CaCO}_3}{L}$$

7.

$$[\text{Coliforms}] = 9000 \frac{\text{coliform}}{\text{m}^3} \times \frac{1 \text{ m}^3}{1000 \text{ L}} \times \frac{1 \text{ L}}{1000 \text{ mL}}$$

$$[\text{Coliforms}] = 9 \times 10^{-3} \frac{\text{coliform}}{\text{mL}}$$

Therefore, in 100 mL, there are $9 \times 10^{-3} \frac{\text{coliform}}{\text{mL}} \times 100 \text{ mL} = 0.9 \text{ coliforms}$

8. Global warming potential of methane from

- Landfills:

$$6709 \text{ Gg CH}_4 \times 25 \frac{\text{g CO}_2\text{-eq}}{\text{g CH}_4} = 167,725 \text{ Gg CO}_2\text{-eq}$$

- Wastewater Treatment Plants (WWTPs):

$$1758 \text{ Gg CH}_4 \times 25 \frac{\text{g CO}_2\text{-eq}}{\text{g CH}_4} = 43,950 \text{ Gg CO}_2\text{-eq}$$

- Percent of annual methane emissions that come from landfills and WWTPs:

$$\frac{(167725 + 43950) \text{ Gg CO}_2\text{-eq} \times \frac{1 \text{ Tg}}{1000 \text{ Gg}}}{556.7 \text{ Tg CO}_2\text{-eq}} \times 100 \% = 38 \% \text{ of annual methane emissions}$$

- Percent of annual greenhouse gas (GHG) emissions that come from landfills and WWTPs:

$$\frac{(167725 + 43950) \text{ Gg CO}_2\text{-eq} \times \frac{1 \text{ Tg}}{1000 \text{ Gg}}}{7074 \text{ Tg CO}_2\text{-eq}} \times 100 \% = 3 \% \text{ of annual GHG emissions}$$

9.

$$\text{TS} = \frac{(13.020 - 12.819) \text{ g}}{0.2 \text{ L}} \times \frac{1000 \text{ mg}}{\text{g}} = 1005 \frac{\text{mg}}{\text{L}}$$

$$\text{FS} = \frac{(12.982 - 12.819) \text{ g}}{0.2 \text{ L}} \times \frac{1000 \text{ mg}}{\text{g}} = 815 \frac{\text{mg}}{\text{L}}$$

$$\text{VS} = \text{TS} - \text{FS} = 1005 - 815 = 190 \frac{\text{mg}}{\text{L}}$$
